Generators in Python -

① Python generators are a simple way of creating iterators.

② Python generator is nothing but a function. In generator return keyword is not available instead it uses yield keyword / statement.

```
def addition():
    a = 10
    b = 20
    c = a + b
    return c

result = addition()
print(result)
```

10+20=30

→ 30

```
def gen_demo():
    yield "first statment"
```

} fun def

```
    yield "second statment"
    yield "third statment"
```

```
gen = gen_demo()  # fun call
print(gen)  ⟶  generator object
```
