Multi-threading in Python.

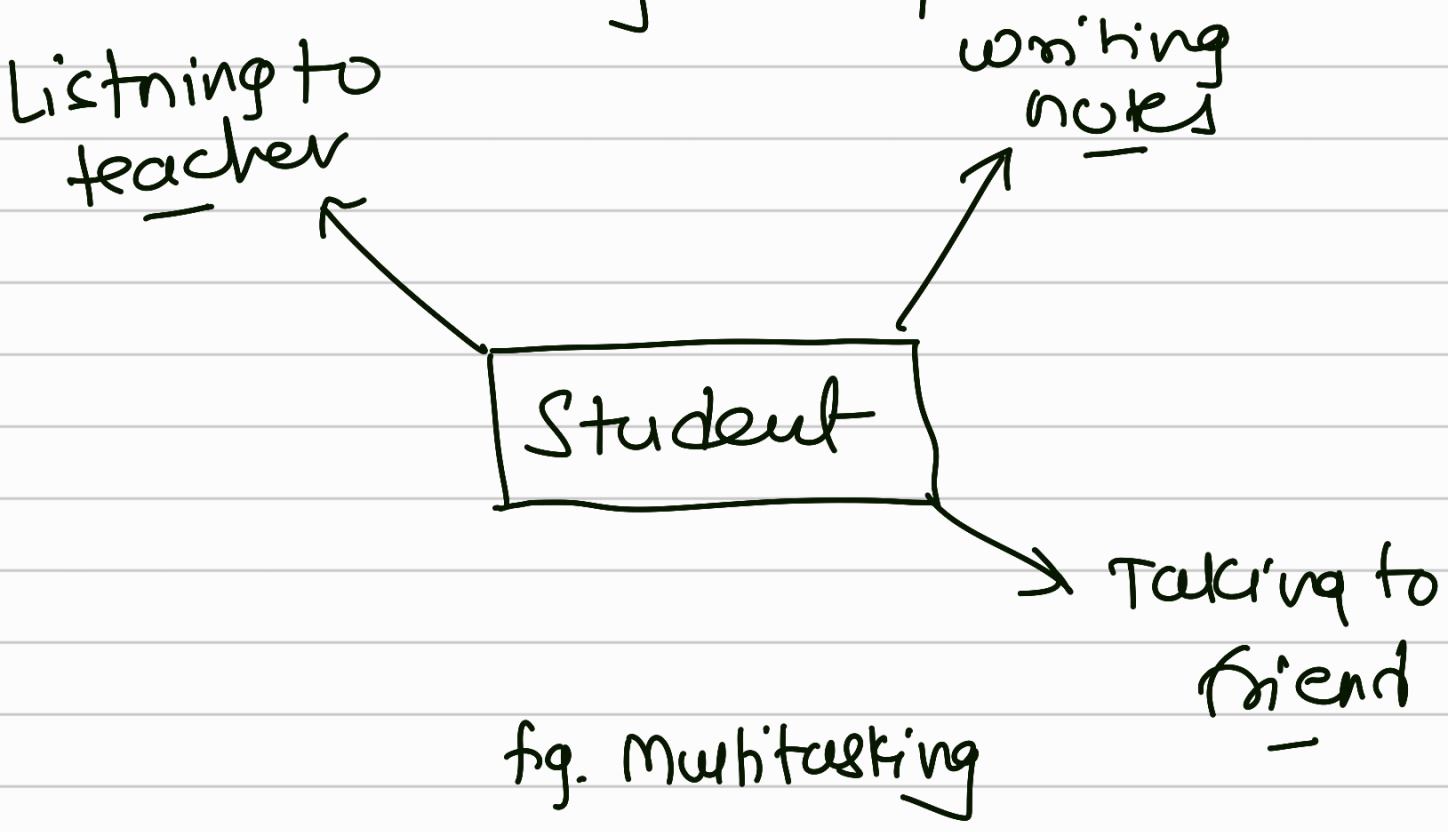

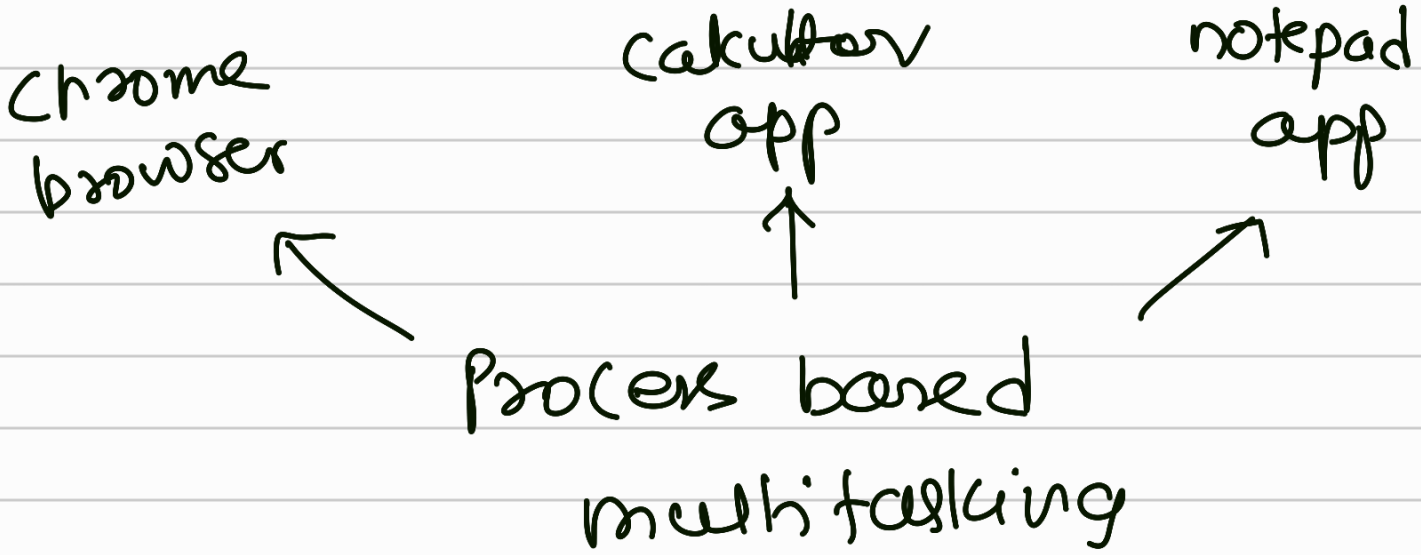

fig. Multitasking

Types of Computer multitasking :

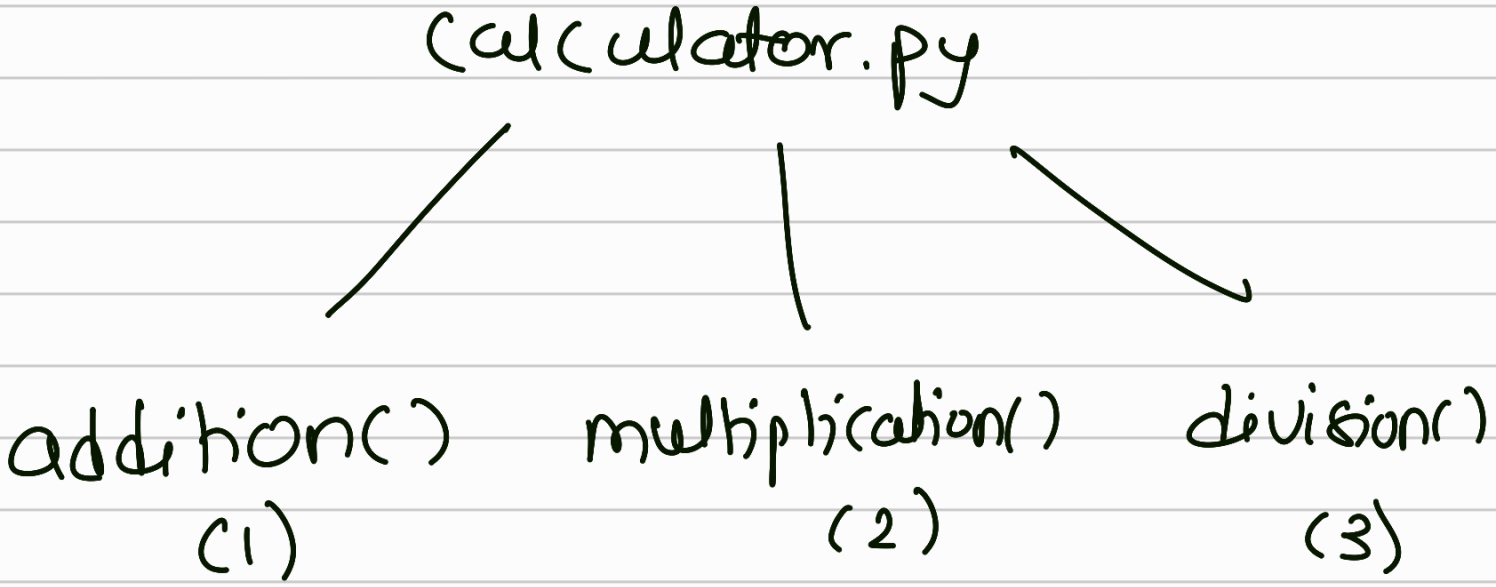

There are two types

1. Process based multitasking

(Application level multitasking)

2) Threading based multi-tasking
(Program level multitasking)

addition() — 10 sec

multiplication() — 10 sec

division — 10 sec.

calculator.py

```
def addition():
```

def multiplication():

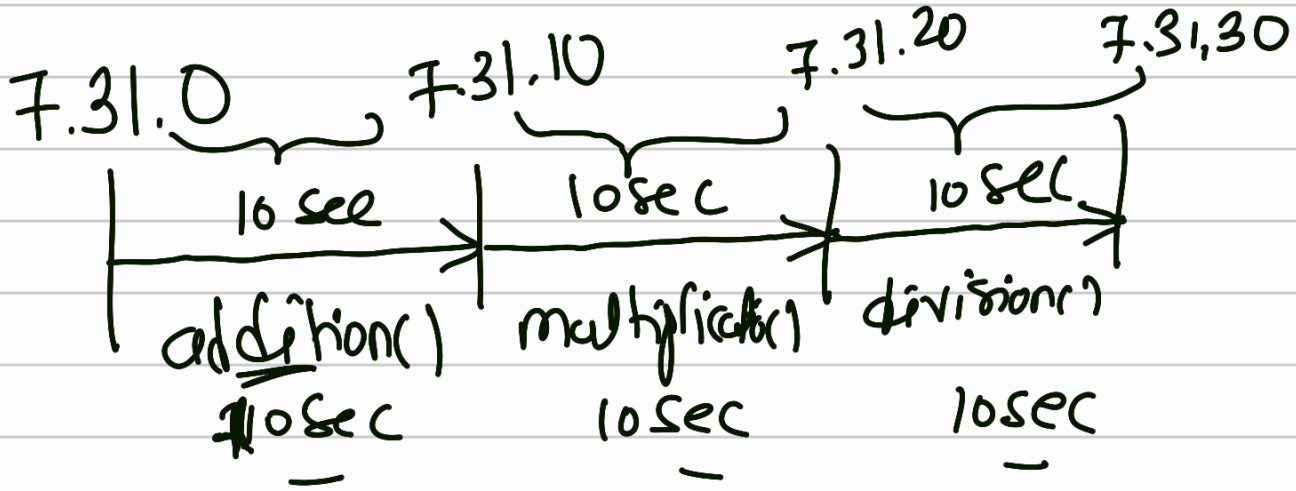

def division():

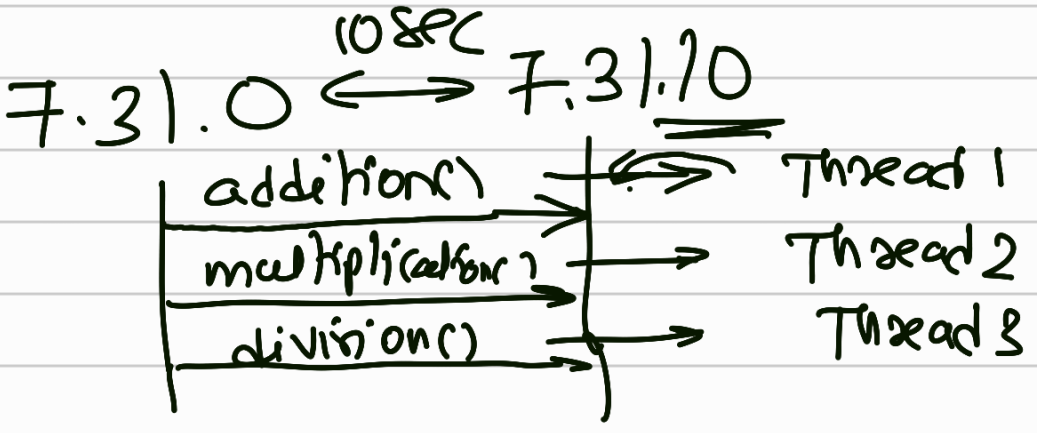

addition() . 7.31 -> 7.31.10

multiplication() 7.31.20

division() 7.31.30

(30 sec)

What is Thread ?

- Thread is used to execute the

instructions in the program.

- It is the smallest execution unit in the program
- By default we have only one thread in our program. It is called as main thread.
- There will be only one default main thread in the program until we explicitly implement multi-threading.
